

Script Software Requirements:

1. PowerShell - installed by default in Windows 7 or Version 2 if you are running XP.
2. Microsoft Office 2010 (Excel)
3. EMC Solution Enabler 7.5 or greater. See below for a registry fix needed to install SE 7.5 on windows 7.

(Solutions enabler can be found on <https://powerlink.emc.com>)

"Cannot install Solutions Enabler on Windows 7."

Knowledgebase Solution

Environment:	OS: Microsoft Windows 7
Environment:	EMC SW: Solutions Enabler SYMCLI 7.5.0
Environment:	EMC SW: Solutions Enabler 7.5.0
Problem:	Cannot install Solutions Enabler on Windows 7.
Problem:	Popup error: Aborting installation....Installation is not supported on Windows 7
Root Cause:	Solutions Enabler 7.5 is not officially supported on Windows 7.
Fix:	Workaround: Here is an unofficial workaround. It is not endorsed or approved by engineering but it has worked for us in our testing. Use at your own discretion: 1. Run regedit command. 2. Go to HKEY_LOCAL_MACHINE\SOFTWARE\EMC and create a new REG_SZ registry key called SE_ON_W7 With this registry hack in place, you should be able to install Solutions Enabler. Please be advised that this is not officially supported and feedback has been provided to engineering to change this going forward. As of this writing, SE 7.4.0.6 is the only available supported version of Solutions Enabler on Windows 7.
Notes:	This article is for support only and should not be provided to customers.

Setup Configuration:

1. Verify you have Solution Enabler in your system path and version. Open a command prompt and type symcli version. (note: Solution Enabler must be in your default path)
2. Verify you have set the proper permission for the execute PowerShell scripts.
 - a. Set the PowerShell execution policy to enable scripts to run. Type '*Set-ExecutionPolicy unrestricted*' at the PowerShell prompt.

Example:

Open a command prompt: Click on Start, Run, Type CMD.

Start PowerShell; Type PowerShell.

Once you are in PowerShell you can set your execution policy to unrestricted.

C:\PS> Set-ExecutionPolicy unrestricted

(Once you have perform step 2 on your computer , should not have to set this again.)

Gather file for the script:

1. Symapi_bin file from the array management server.
 - a. This should be in Program Files\EMC\symapi\db folder.
2. A backup copy of the ACLX database.
 - a. Login to the array management server.
 - b. Open a command prompt.
 - c. Type: symaccess -sid <last 4 of array serial number> backup -f aclxdb.db
 - i. Example symaccess -sid 123 backup -f aclxdb.db
 - d. Type y to accept the backup.

- e. This will create a file called aclxdb.db.
3. Copy both aclxdb.db and symapi.bin to your computer.

Running the script:

1. Open a command prompt
 - a. Click on start, run, type cmd.
2. Change directory to the location of the CRG scripts.
 - a. Example c:> cd /scripts
3. Type in PowerShell
 - a. Example c:>powershell
4. Execute the script.
 - a. Example c:ps> .\vMAX_CRG_V4.0.2.ps1
5. Script will first prompt you for the symapi bin file, then the aclxdb.db file.
